-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 June 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-30 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☒ Claim(s) 11,12,24-27,29 and 30 is/are allowed.
- 6) ☒ Claim(s) 1-10,13-23 and 28 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-10, 13-22 and 28 are rejected under 35 U.S.C. 102(e) as being anticipated by Hamabe (US 2002/0111163).

Regarding claims 1, 13 and 28, Hamabe teaches a cell search control method by which a mobile station searches for a perch channel transmitted by a base station to capture and receive the perch channel, and determines which base station to communicate with or to be standby (figure 2) for, said cell search control method comprising: a measuring step of measuring receiving quality of a currently captured perch channel; and a control step of determining a frequency of searching for a new perch channel in response to the receiving quality measured by said measuring step (§ 0068, 0070 & 0078).

Regarding claims 2 and 14, Hamabe teaches said measuring step measures received power of the currently captured perch channel; and said control step controls the frequency of searching for a new perch channel in response to the highest received power measured by said measuring step such that when the highest received power is high, the frequency of searching for a new perch channel is low, whereas when the highest received power is low, the frequency of searching for a new perch channel is high (§ 0073).

Regarding claims 3 and 15, Hamabe teaches said measuring step measures received power of the currently captured perch channel; and said control step controls the frequency of searching for a new perch channel in response to the ratio of the second highest received power to the highest received power measured by said measuring step such that when the ratio is high, the frequency of searching for a new perch channel is high, whereas when the ratio is low, the frequency of searching for a new perch channel is low (§ 0083 & 0084).

Regarding claims 4 and 16, Hamabe teaches said measuring step measures received power of the currently captured perch channel; and said control step controls the frequency of searching for a new perch channel in response to the number of perch channels with received power whose ratio to the highest received power measured by said measuring step is greater than a predetermined value such that when the number of perch channels is great, the frequency of searching for a new perch channel is high, whereas when the number of perch channels is small, the frequency of searching for a new perch channel is low (figure 6, steps 702 & 708).

Regarding claims 5 and 17, Hamabe teaches said measuring step measures a received SIR of the currently captured perch channel; and said control step controls the frequency of searching for a new perch channel in response to the highest received SIR measured by said measuring step such that when the highest received SIR is high, the frequency of searching for a new perch channel is low, whereas when the highest received SIR is low, the frequency of searching for a new perch channel is high (§ 0074).

Regarding claims 6 and 18, Hamabe teaches said measuring step measures a received SIR of the currently captured perch channel (§ 0074); and said control step controls the frequency of searching for a new perch channel in response to the ratio of the second highest received SIR to

Art Unit: 2684

the highest received SIR measured by said measuring step such that when the ratio is high, the frequency of searching for a new perch channel is high, whereas when the ratio is low, the frequency of searching for a new perch channel is low (§§ 0113 & 0156).

Regarding claims 7 and 19, Hamabe teaches said measuring step measures a received SIR of the currently captured perch channel (§§ 0074); and said control step controls the frequency of searching for a new perch channel in response to the number of perch channels with a received SIR whose ratio to the highest received SIR measured by said measuring step is greater than a predetermined value such that when the number of perch channels is great, the frequency of searching for a new perch channel is high, whereas when the number of perch channels is small, the frequency of searching for a new perch channel is low (§§ 0113 & 0156).

Regarding claims 8 and 20, Hamabe teaches an extracting step of decoding a received perch channel, and extracting transmission power information, the perch channel including its own transmission power information (§§ 0066), wherein said measuring step measures received power of a currently captured perch channel; and said control step obtains a propagation loss between the mobile station and a base station that transmits the perch channel from the received power measured by said measuring step and the transmission power of the perch channel with the received power extracted by said extracting step, and controls the frequency of searching for a new perch channel in response to the minimum propagation loss obtained such that when the minimum propagation loss is high, the frequency of searching for a new perch channel is high, whereas when the minimum propagation loss is low, the frequency of searching for a new perch channel is low (§§ 0105 & 0131).

Regarding claims 9 and 21, Hamabe teaches an extracting step of decoding a received perch channel, and extracting transmission power information, the perch channel including its own transmission power information (§ 0066), wherein said measuring step measures received power of a currently captured perch channel; and said control step obtains a propagation loss between the mobile station and a base station that transmits the perch channel from the received power measured by said measuring step and the transmission power of the perch channel with the received power extracted by said extracting step, and controls the frequency of searching for a new perch channel in response to the ratio of the second minimum propagation loss to the minimum propagation loss obtained such that when the ratio is low, the frequency of searching for a new perch channel is high, whereas when the ratio is high, the frequency of searching for a new perch channel is low (§ 0105 & 0131).

Regarding claims 10 and 22, Hamabe teaches an extracting step of decoding a received perch channel, and extracting transmission power information, the perch channel including its own transmission power information (§ 0066), wherein said measuring step measures received power of a currently captured perch channel; and said control step obtains a propagation loss between the mobile station and a base station that transmits the perch channel from the received power measured by said measuring step and the transmission power of the perch channel with the received power extracted by said extracting step, and controls the frequency of searching for a new perch channel in response to the number of perch channels with a propagation loss whose ratio to the minimum propagation loss obtained is less than a predetermined value such that when the number of the perch channels is great, the frequency of searching for a new perch

Art Unit: 2684

channel is high, whereas when the number of the perch channels is small, the frequency of searching for a new perch channel is low (§ 0105 & 0131-0137).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hamabe (US 2002/0111163) in view of Higuchi et al (US 2002/0016190)

Regarding claims 23, Hamabe fails to specifically disclose the mobile station monitoring paging to itself by intermittent reception in a standby mode. However, it is well known in the art, as taught by Higuchi to have a mobile station monitor paging to itself by intermittent reception in a standby mode (§ 0005). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include have the mobile station monitor paging to itself by intermittent reception in a standby mode with Hamabe's invention in order to reduce power consumption and save battery power.

Allowable Subject Matter

Claims 11, 12, 24-27, 29 and 30 are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claims 11, 24 and 29 the prior art of record fails to specifically disclose a mobile station searches for a perch channel transmitted by a base station to capture and receive the perch channel, and determines which base station to communicate with or to be standby for, said cell search control method comprising: a measuring step of measuring transmission power of a signal to be transmitted to the base station that the mobile station currently communicate with or is currently standby for; and a control step of controlling a frequency of searching for a new perch channel in response to the lowest transmission power measured by said measuring step such that when the lowest transmission power is high, the frequency of searching for a new perch channel is high, whereas when the lowest transmission power is low, the frequency of searching for a new perch channel is low. More specifically, that a frequency of searching for a new perch channel is controlled in response to the lowest transmission power of measured transmission power (transmission power at time of transmitting a signal to a base station that a mobile station currently communicate with or is currently standby for) such that when the lowest transmission power is high, the frequency of searching for a new perch channel is high, whereas when the lowest transmission power is low, the frequency of searching for a new perch channel is low.

Regarding claims 12, 26 and 30, the prior art of record fails to specifically disclose a method by which a mobile station searches for a perch channel transmitted by a base station to capture and receive the perch channel, and determines which base station to communicate with

Art Unit: 2684

or to be standby for said cell search control method comprising: a detecting step of detecting a moving speed of the mobile station; and a controlling step of controlling a frequency of searching for a new perch channel in response to the moving speed detected by said detecting step such that when the moving speed is high, the frequency of searching for a new perch channel is high, whereas when the moving speed is low, the frequency of searching for a new perch channel is low. More specifically, that a frequency of searching for a new perch channel is controlled in response to a detected moving speed such that when the moving speed is high, the frequency of searching for a new perch channel is high, whereas when the moving speed is low, the frequency of searching for a new perch channel is low.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Response to Arguments

Applicant's arguments filed 6/6/03 have been fully considered but they are not persuasive.

Regarding applicant's arguments that Hamabe fails to specifically disclose the limitation as cited in each of the pending independent claims, the limitation being a step of measuring or controlling "a frequency of searching for a new perch channel". Applicant is requested to review figure 9, followed by an explanation in paragraphs 0103-0120. Applicant sites that Hamabe does not appear to have any description the determining or controlling of a frequency of searching for

Art Unit: 2684

a new perch channel. However, in paragraph 0111-0116, Hamabe specifically discloses that if the equations discussed in figure 9 are satisfied, i.e., after measuring the receiving quality of the captured perch channel the information concerning plural codes which have a possibility to be used in the perch channels, than the mobile station can set the carrier frequency for receiving the perch channel (§ 0116).

Regarding applicant's arguments in lieu of Higuchi, applicants argues that Higuchi also does not disclose the recited features that a frequency of searching for a new perch channel is determined (or controlled) in response to measured receiving quality of a perch channel. However, it was not examiner intention to use Higuchi as a main reference to show that the teachings of Higuchi disclose a perch channel and the limitations disclosed in applicant's independent claims. But rather to show that that intermittent reception is well known in the art and is widely used.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US 2003/0112853 teaches a spread communication system and mobile station thereof.

US 6,597,674 teaches a handover method, base station, mobile station, and mobile communication system.

US 5,873,047 teaches a method for setting up perch channels in mobile communication by cellular system.

Art Unit: 2684

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

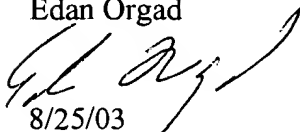

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Edan Orgad whose telephone number is 703-305-4223. The examiner can normally be reached on 8:00AM to 5:30PM with every other Friday off..

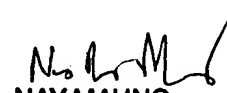

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nay Maung can be reached on 703-308-7745. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
